Understand today's investment challenges and the role of the Bloomberg system In recent years, changes have swept through the investment industry like wildfire. Academia has followed along and provided new lenses for viewing this transformation, as well as new strategies for gaining a true understanding and knowledge of investment and financial markets. Now, *Equity Markets and Portfolio Analysis* has been created to further inform investment professionals and finance students on the basic concepts and strategies of investments, and to provide more detailed discussions on advanced strategies and models. The concepts covered in this book will help readers gain a better understanding of the markets and uses for an increasing number of securities, strategies, and methodologies. *Equity Markets and Portfolio Analysis* is the only core investment book that covers the functionality of Bloomberg terminals, increasingly critical tools both in the classroom and on the trading floor. As Bloomberg terminals now play a key role in the research, teaching, and managing of student investment funds, understanding the system's information and analytical functions has become more important than ever. In-depth coverage of fundamentals through more detailed concepts for students and professionals who want to better understand the evaluation, selection, and management of securities One-of-a-kind training and instructional course, introduction to Bloomberg investment subjects, and reference for CFA preparation Bloomberg material provided in an appendix accompanying each chapter, a useful option for professors Ideal for finance practitioners, investment bankers, and academics This unique resource will give readers both the foundational knowledge and the analytical tools necessary for investment success, both in the classroom and in the

real world. This book constitutes the refereed conference proceedings of the 11th International Conference on Multi-disciplinary Trends in Artificial Intelligence, MIWAI 2017, held in Gadong, Brunei, in November 2017. The 40 revised full papers presented were carefully reviewed and selected from 82 submissions. They are organized in the following topical sections: knowledge representation and reasoning; data mining and machine learning; deep learning and its applications; document analysis; intelligent information systems; swarm intelligence.

My little support notebook level 1 is a notebook with lineage of color (4 colors: blue, green, brown and red) for dyspraxic, dyslexic or dysgraphic children. This color system makes it easier for children to find their way around the space on the sheet. They can that way learn and practice their writing skills with a tool more appropriate to their condition. This small notebook is composed of two center lines with a spacing of $2/64$ in (lines brown and green) and two external lines with a spacing of $9/32$ in. Notebook with 40 pages (also available in 80 pages and size 8.5'x11'). The book is based on practical experience gained during the planning and execution of e-governance projects in India coupled with extensive research based on six national/multi-state-level agriculture related projects. It assesses e-governance projects in terms of desired project outcomes and analyzes performance from the viewpoints of three key groups – planners, implementers and beneficiaries. It highlights six constructs: extent of planning, comprehensiveness of strategy formulation, effectiveness of strategy implementation, changing situation, stakeholder competence levels and flexibility of processes, which are applied to reveal shortfalls in the existing planning and implementation system for e-governance projects in India. It also identifies a set of significant strategic variables influencing performance based on three independent opinion surveys of

stakeholders located across the country, and uses these variables as the basis of strategic gap analyses of some major ongoing agriculture related projects. Furthermore it presents lessons learned from cross-case quantitative and qualitative analyses in the form of a generalized strategic framework for improving performance. Offering an overview of major e-governance projects, it uses several illustrative examples to address the underlying issues and to support the study findings and recommendations. It also presents a novel approach of building strategic alliances across related departments to achieve effective e-governance. The book will be of interest to the practitioners in government as well corporates who are engaged in planning and implementation of e-governance projects spanning across various layers of government. In Indian context, the learning issues are likely to trigger appropriate corrective measures for generating better value from the several flagship projects envisaged under the Digital India Programme. Further, it will interest the academic audience working on the strategic framework and constituting constructs. It will also benefit business students and application software architectures who aspire for a consulting career in the area of e-governance. The increased attendance required concurrent sessions for the 48 oral presentations and 190 submitted posters (for more details see Website: www.ct.ornl.gov/symposium). Attendees came from Australia, Austria, Belgium, Brazil, Canada, China, Denmark, Finland, Germany, Hungary, India, Japan, Korea, Mexico, The Netherlands, Russia, South Korea, Spain, Sweden, Turkey, and Venezuela, as well as from the United States. This international perspective was continued in a Special Topic Session sponsored by the International Energy Agency (IEA) Bioenergy Program on Biofuels and chaired by Jack Saddler and David Gregg from the University of British Columbia. Several of the 10 member

countries in this network are approaching Demonstrations of the Biomass-to-Ethanol process and have a range of more fundamental projects that look at various aspects of pretreatment, enzymatic hydrolysis, fermentation, and lignin utilization. Presenters from several of the participating countries described their country's biomass-to-ethanol projects, and differential factors such as the type of biomass available, the maturity of the wood or agricultural processing industry, and the willingness of government to bear the risk/ cost of development and demonstration. This book is designed for software engineering students and project management professional in the IT and software industry. It focuses on the four phases of management -- planning, organizing, monitoring, and adjusting (POMA) -- and tailors to systems and applications on software projects. The tasks and techniques utilized in each of the POMA management phases are discussed with specific software engineering and IT related examples. Drawing from years of experience in the industry, the author presents material within a framework of real-world examples and exercises that help readers apply new concepts to everyday situations. Includes an annual Outlook issue. A guide for experienced programmers demonstrates the core JavaScript language, offers examples of common tasks, and contains an extensive reference to JavaScript commands, objects, methods, and properties. Learn all the core tools needed to create Web pages Businesses, special-interest groups, families, and individuals are all relying on Web sites to communicate. This all-in-one guide offers one-stop shopping for all the information you need to put together powerful Web pages to get your point across and keep visitors coming back. Nine individual minibooks cover best design practices, online tools, Microsoft Expression Web, Dreamweaver, cascading style sheets, HTML and XHTML, graphics and

multimedia, scripting, and Flash, arming you to create professional-looking pages. Knowing how to build an effective Web site is important to businesses, groups, and even individuals today; this guide teaches how to use all the basic Web page tools Explains what goes into a well-designed page and how to use available online tools such as Google Page Builder and Blogger as well as Microsoft's popular Expression Web tool, Dreamweaver, and CSS Covers the core language behind Web sites, using graphics and multimedia, JavaScript, and Flash Creating Web Pages All-in-One For Dummies prepares anyone to build Web pages that get attention. SRA Early Intervention is a systematic, explicit curriculum which helps beginning readers acquire the skills and strategies to be successful readers. This book provides an introduction and application of statistics to business analytic problems. This book discusses financing and documenting joint ventures and early-stage strategic partnerships; devising workable nondisclosure agreements and managing an intellectual property portfolio. Innovations and Advances in Computer Sciences and Engineering includes a set of rigorously reviewed world-class manuscripts addressing and detailing state-of-the-art research projects in the areas of Computer Science, Software Engineering, Computer Engineering, and Systems Engineering and Sciences. Innovations and Advances in Computer Sciences and Engineering includes selected papers form the conference proceedings of the International Conference on Systems, Computing Sciences and Software Engineering (SCSS 2008) which was part of the International Joint Conferences on Computer, Information and Systems Sciences and Engineering (CISSE 2008). Written by renowned author Anita Tull and experienced teacher and examiner Alison Palmer, this student book covers both Units of the WJEC Vocational Award in Hospitality and Catering. It is endorsed by

WJEC, providing high quality support you can trust. // Suitable for Level 1 and 2 students, the depth of coverage, language and design of the book has been carefully tailored to their learning needs. // Content is presented in a visually engaging fashion, with bite-sized chunks of information together with bulleted lists, charts, tables, spider-grams and more to help ensure students engage with the content in a meaningful way. // Plenty of practical activities together with learning features such as 'Put it into Practice' and 'Scenarios' help students translate their knowledge and understanding to the world of work. // Short and extended answer style questions throughout help prepare students for assessment. // Stretch and challenge activities encourage students to work towards achieving a higher grade. Almost 80% of CEOs say that their organization must get better at managing external relationships. According to *The Economist*, one of the major reasons why so many relationships end in disappointment is that most organizations 'are not very good at contracting'. This ground-breaking title from leading authority IACCM (International Association for Contract and Commercial Management) represents the collective wisdom and experience of Contract, Legal and Commercial experts from some of the world's leading companies to define how to partner for performance. This practical guidance is designed to support practitioners through the contract lifecycle and to give both supply and buy perspectives, leading to a more consistent approach and language that supports greater efficiency and effectiveness. Within the five phases described in this book (Initiate, Bid, Development, Negotiate and Manage), readers will find invaluable guidance on the whole lifecycle with insights to finance, law and negotiation, together with dispute resolution, change control and risk management. This title is the official IACCM operational guidance and fully supports and aligns with the course modules for

Preface In the past three decades, businesses have made staggering investments in technology to increase their productivity and efficiency. The technological infrastructure of these companies has become increasingly sophisticated and complex. Most companies today are extremely dependent on their technological infrastructure. Operating without it is like trying to run a business without a telephone or electricity. Businesses depend on their technology at least as much as, perhaps more than, any other utility. However, unlike the telephone and electric industries, technology has not had the benefit of 100 + years to mature under the control of a handful of companies. Thousands of companies contribute to technology, each doing whatever they think will sell the best. Extreme and rapid innovation is the rule, not the exception. Change is the rule, not the exception. The resulting complexity has posed a new challenge for companies: how to realize the potential and anticipated benefits of the investments in an environment of constant change. Businesses are so reliant on technology that they need it to operate as reliably, consistently, and universally as the telephone and electricity. We are a long way from achieving that level of service. Businesses face rising costs because of constant failures that result in lost productivity. It is very difficult and expensive to find the resources

with the expertise to manage and repair their infrastructures. It is extremely difficult and expensive to keep those resources trained to manage a constantly evolving environment. But guess what. There is no choice but to invest in technology, because it has to be done. Business cannot stop investing in technology or they will be crushed by the competition. So what have they done? They have standardized to limit the diversity, the expertise required, and the problems associated with diversity. They have striven to make the infrastructure as reliable as the telephone and to keep employees productive. And they have created a team that has the skills, the facilities, and the charter to fix existing problems and reduce future problems. That team is the service center, and this book shares how the best of those teams are doing just that. Technology impacts more than just a business's internal operations. What about the company's customers? They often need support, as well. More companies are realizing the value of providing quality service to its customers. Some studies have indicated that keeping a customer costs one-tenth the price of getting a new one, while the return business from satisfied customers count for substantially more than one-tenth of a company's revenue. It makes good economic sense to spend money on keeping existing clients satisfied. For many companies, that means providing customers with quality support for the products and services they purchase. So who in the company provides that service? You guessed it—the service center. What is a service center? It is an organization whose charter and mission are to provide support services to internal or external customers, or to both. It is a concentration of expertise, processes, and tools dedicated to taking customers' requests and fulfilling them in a timely and cost-effective manner, leaving the customer delighted with the experience. A service center has a defined range of service offerings, from fixing problems to providing

value-added services, and everything in between. This book is intended to help a company set up that service center and deliver those services cost effectively. The book focuses on structuring the organization and building the processes to move service requests efficiently and effectively through the organization to deliver quality service to the customer. It discusses the pitfalls that afflict many service centers and offers techniques and solutions to avoid those pitfalls. The book discusses the tools available to help a service center manage its business and deliver high quality cost-effective services to customers. The traditional help desk is still around, but many have evolved into service centers. As more businesses are faced with increasing technology costs and increasing pressure to be productive and efficient internally—while delighting external customers—many more help desks will be forced to evolve. For a well-run help desk, the evolution is natural and not overly difficult. Most help desks were originally designed to provide one type of service, technical support. Help desks traditionally helped customers by fixing their problems and answering their questions. The help desk concentrated technical expertise, problem management processes, and tools to track and resolve customer problems, answer customer questions, and deliver that support as cost effectively as possible. Many help desks have done this quite successfully, and many have not. As their companies reengineer and look to streamline operations, many company executives have asked the simple question, "Today, you provide one type of service—technical support. How hard would it be to add additional services?" It's a fair question, because the help desk already takes service requests, tracks them, makes delivery commitments to customers, delivers the services, and charges the customers. The organization, the processes, the tools are in place. The evolution usually starts small, with simple, technology-related, value-

added services, such as ordering PCs. You need a PC, contact the help desk. They'll figure out what you need, order it, track the order, install it when it arrives, and then support you if you have any questions. Voila, the help desk is now providing value-added services. Since you are ordering the equipment and maintaining and fixing it all the time, how about keeping track of it? No one else does. Again, voila, you're providing a value-added asset management service. Since you have all of that valuable information, can you report on it quarterly to the insurance and risk anagement department and the finance and accounting group? Yep, another—value added service. Hey, you guys are pretty good at this stuff. We need computer training. Can you make arrangements for that and then handle the scheduling? Its happened. You are no longer just a help desk—you are a service center, offering both traditional help desk support and value-added services to your customers. This goes along for a while, and you tweak the processes and improve your delivery capability. Then, someone in the company gets the idea that a single point of contact for many internal services would be handy, and since you're already capable of handling value-added servicesand you do it so well, you should consider handling many more. That certainly sounds reasonable. For example, how about a service for new employees. Instead of the HR department contacting the telecom department, the help desk, and the facilities department every time a new employee is hired, why don't they just contact the service center and let them coordinate the rest. Like magic, you've added a service called New Employee Setup, or maybe even better, Amaze the New Employee. You gather the vital information—her name, who she works for, when she starts, what budget to charge, where she'll be sitting. You order her PC, you contact telecom to set up her phone and voice mailbox, and you contact facilities to set up her workspace.

Then, you notify security and set up her appointment to get a badge, you schedule her into the next orientation class, and you schedule her in the next "PC and Networking in Our Company" class. Finally, you generate the standard welcome-on-board letter that tells her the classes she is scheduled for and where they are located. You have standard attachments that explain how to use the phone and how to log on to the PC, and most importantly, how to reach the service center. You email the package to HR, who is merely awaiting her arrival, secure in the knowledge that all is well, everything is ready, and that the new employee will be duly impressed with her new company. Just as you do with the problems you handle, you follow up on this service to make sure the work is done on time. Now your follow-up includes telecom and facilities, who essentially act like any other tier 2 group. Instead of generating a trouble ticket, you generate a tracking ticket, which is associated with another new type of ticket, a work order. One work order is sent to telecom and another to facilities. The new tracking ticket looks amazingly similar to a trouble ticket. It has the same contact information—the customer name and location, the desired delivery date, the name of the agent who took the order, when the order was placed, the current status, and who else is involved. Work order tickets really aren't much different than a traditional trouble ticket to dispatch, for example, a hardware support technician that includes information on where to go, what needs to be done, when it needs to be done, who is handling it, its current status and priority, and so on. The work order ticket even goes into a queue, just like a problem ticket dispatched to any tier 2 support group. And just as with trouble tickets, you have processes and tools in place to escalate the tracking and work order tickets, and to send notifications if there is a problem or if more work to be done. The entire process is, logically, very similar to managing problems. The information must

be tracked, people are assigned to do the work, the work is prioritized, time commitments are in place, processes are in place to handle work that can't be done in the agreed upon time frame, additional levels of expertise are available to handle difficulties. Perhaps most importantly, it is all initiated, tracked, and closed centrally. Many help desks resist this evolution. If their house is not in order and they are struggling to handle technical support, they should resist. Get the technical support in order first. Work on your problem management processes and take advantage of your existing tools. When your problem management processes are working, they'll work just as well for other value-added services. That is the secret. If you can make and meet time commitments for technical support to customers, you can easily add new value-added services to your repertoire. Value-added services are like the simplest, most common, recurring problems your customers call about. They're easy because the request is common, so everyone is familiar with it. The solution is known; its predefined. Processes to deliver the solution are already in place. Processes to deal with unexpected complications are already defined and in use. Simple. You have the tools, the people, the processes, the organization, and the experience.

Overview This book was written because problem management is one of the most important processes for any IT organization. Yet, of the hundreds of companies we have worked with, it is most often not done well. It seems that many companies consider problem management only as an afterthought, a necessary evil, overhead, or worse, all of the above. So what is problem management? Problem management is a formal set of processes designed and implemented to quickly and efficiently resolve problems and questions. Those problems and questions come from customers, both internal and external. Why is problem management important? Because how well you do at resolving those

problems and questions determines how your customers perceive you. Further, how you provide those services can make an enormous difference in your overall costs—not only your costs, but also the costs your customers incur. Do a poor job on your problem management processes and your customers will think ill of you. Internal customers can be the most vicious, because they know who to complain to. They also complain to each other, and before you know it, the entire company believes you to be incompetent, at least as far as problem management goes. Worse, that attitude can easily fail over to the entire IT department. Let's face it—most of the IT department's exposure is through the problem management function (the help desk) and that is where your reputation will be made or broken. It isn't hard to justify spending to improve problem management when you calculate the number of hours of internal downtime and the average cost per hour the company absorbs for that downtime. Run the numbers and see for yourself. External customers can be less vicious on a personal level, but from the business perspective, their impression is even more important. If they don't like the way you handle problems, they may complain, but worse, they will most certainly vote with their dollar by taking it elsewhere—and will probably tell everyone they know to do the same. Your company worked hard and spent significant dollars to win that customer. To lose them because you provided poor service is an enormous waste. What will it cost you to win them back? Can you win them back? Can you ever win their friends and associates? Many studies have found that it is much cheaper to keep a customer than to win a new one. If your company hasn't seen this light yet, you need to convince them. This book was written to tell you what you can and should consider doing to improve your problem management processes. It is based on experience gained at many different sites and focuses on

improving service delivery and efficiency. It's true—you can do it better and cheaper. You may have to spend some capital up front, but a standard project cost/benefit analysis will show that you can recoup those costs quickly, and in some cases, can generate significant dollars. This book was written for CIOs, vice presidents, help desk and service center managers, and the senior-level internal customers of the problem management department—anyone who can influence the problem management function and wants to understand more about what can and should be done to improve performance.
