Disease Control Priorities, Third Edition (Volume 5) Oct 04 2020 Cardiovascular, respiratory, and related conditions cause more than 40 percent of all deaths globally, and their substantial burden is rising, particularly in low- and middle-income countries (LMICs). Their burden extends well beyond health effects to include significant economic and societal consequences. Most of these conditions are related, share risk factors, and have common control measures at the clinical, population, and policy levels. Lives can be extended and improved when these diseases are prevented, detected, and managed. This volume summarizes current knowledge and presents evidence-based interventions that are effective, cost-effective, and scalable in LMICs.

Lactate Apr 29 2020 This book covers the principal reports and discussions which have been presented during the "Symposium on Anaerobic Metabolism and Lactic Acid" which was held in Anzere (Wallis, Switzerland) from 19th till 20th January 1978 under the patronage of the European Society of Cardiology. ~s Dr. Wilkie and Hermansen mentioned in their paper, Berzelius was the first one who recognized in 1807 "the existence of free lactic acid in the muscular fluid and thought that the amount of free lactic acid in a muscle is proportional to the extent to which it has been previously exercised". Since, many controversies have appeared, not as far as for its presence in the muscle, but as for its relations to oxygen debt or fatigue, to its physiological part, to its metabolism (oxydation or conversion to glycogen in situ), or to its pathological significance in clinical conditions. In this symposium, physiologists and biochemists tried to resolve some of the basic problems, they defined terminology and introduced new facts. Methods to determine the lactic acid or lactate have been reviewed. Lactic acid or lactate in various clinical conditions were the objectives of many collected reports in the last part of the symposium. Clinicians, who are interested in Pneumology, Diabetology, Hepatology, Angiology, Intensive Medicine or Sport Medicine, and particularly cardiologists will find precious information. The organizing committee thanks every reporter, specially the Chairmen, and everyone who took an active part in the preparation or realization of this symposium.

Clinical Use of Calcium Channel Antagonist Drugs Aug 26 2022 Calcium antagonists are now regarded as the most important advance in cardiac drug therapy since the advent of beta-adrenergic blocking agents.

Acting basically as vasodilators-though with many other complex mechanisms especially in the case of the anti arrhythmic calcium antagonists, these agents have grown in importance to become among the therapeutic agents of first choice for angina pectoris and hyper tension. The major aim of the present book is to present the clinician with the information needed for the practical use of calcium antagonists. What do all the numerous and often conflicting trials say? Do these agents really work? If so, which agent and in what dose? How do the three front runners, verapamil, nifedipine and diltiazem compare in the efficacy and side-effects with each other? How do the new second generation agents, now entering the North American market, slot in and compare with the three first-liners? When the gloss is taken away from the advertisements, what is really left? The strong clinical bias of the present book should be complimented by further reading of books slanted towards fundamentals. One of the most important and recent of these is that by Dr Winifred Nayler (Calcium Antagonists, Academic Press, 1988). That book should be basic for essential background knowledge in the area of calcium antagonists. The important basic contributions of Fleckenstein deserve emphasis.

Regulation of Cardiac Contractility Jun 11 2021 Contractility describes the relative ability of the heart to eject a stroke volume (SV) at a given prevailing afterload (arterial pressure) and preload (end-diastolic volume; EDV). Various measures of contractility are related to the fraction as the SV/EDV or the ejection fraction, and the dynamics of ejection as determined from maximum pressure rise in the ventricles or arteries or from aortic flow velocities determined by echocardiography. At the cellular level, the ultimate determinant of contractility is the relative tension generation and shortening capability of the molecular motors (myosin cross-bridges) of the sarcomeres as determined by the rates and extent of Ca activation, the turnover kinetics of the cross-bridges, and the relative Ca responsiveness of the sarcomeres. Engagement of the regulatory signaling cascades controlling contractility occurs with occupancy and signal transduction by receptors for neurohumors of the autonomic nervous system as well as growth and stress signaling pathways. Contractility is also determined by the prevailing conditions of pH, temperature, and redox state. Short-term control of contractility is fully expressed during exercise. In long-term responses to stresses on the heart, contractility is modified by cellular remodeling and altered signaling that may compensate for a time but which ultimately may fail, leading to disorders.
