Achieving Effective Acquisition of Information Technology in the Department of Defense Sep 18 2022 In the military, information

technology (IT) has enabled profound advances in weapons systems and the management and operation of the defense enterprise. A significant portion of the Department of Defense (DOD) budget is spent on capabilities acquired as commercial IT commodities, developmental IT systems that support a broad range of warfighting and functional applications, and IT components embedded in weapons systems. The ability of the DOD and its industrial partners to harness and apply IT for warfighting, command and control and communications, logistics, and transportation has contributed enormously to fielding the world's best defense force. However, despite the DOD's decades of success in leveraging IT across the defense enterprise, the acquisition of IT systems continues to be burdened with serious problems. To address these issues, the National Research Council assembled a group of IT systems acquisition and T&E experts, commercial software developers, software engineers, computer scientists and other academic researchers. The group evaluated applicable legislative requirements, examined the processes and capabilities of the commercial IT sector, analyzed DOD's concepts for systems engineering and testing in virtual environments, and examined the DOD acquisition environment. The present volume summarizes this analysis and also includes recommendations on how to improve the acquisition, systems engineering, and T&E processes to achieve the DOD's network-centric goals.

Information Technology Evaluation Methods and Management Jul 16 2022 The evaluation of IT and its business value are the subject of many academic and business discussions. Investments in IT are growing extensively, and business managers worry about the fact that the benefits might not be as high as expected. This phenomenon is often called the IT investment paradox or the IT Black Hole: large sums are invested in IT that seem to be swallowed by a large black hole without rendering many returns. How to measure the benefits of IT is the concern of this book titled Information Technology Evaluation Methods and Management. The different IT evaluation approaches and methods are discussed and illustrated with cases: traditional financial evaluations such as the return on investment, information economics and the recently introduced IT Balanced Scorecard. The latter approach is proposed as an ideal mechanism to support the IT/business alignment process and its related IT governance process. Among some of the topics included in this book are: software measurement; ERP project evaluation; strategic electronic commerce evaluation.
